

CSS Input Fields in 5 Minutes

Text, Email, Password, Radio Buttons, and Checkboxes

Target Audience: Beginner Web Developers

Goal: Viewers will understand the different types of input fields and how CSS is used to style them.

0:00 - 0:45 | Introduction

Host on Camera:

"Have you ever filled out a website form and wondered how those text boxes and buttons are made?"

"Those are called input fields, and they are commonly used when websites need information from the user."

"Today, we're going to learn five common input fields: text fields, email fields, password fields, radio buttons, and checkboxes."

"We'll also look at how CSS helps us make these fields look better. Let's get started."

0:45 - 2:00 | Concept Explanation

Screen Share: Show a simple HTML form with different input fields.

The Basics:

"First, an input field is an HTML element used to receive information from the user."

"Different types of input fields have different purposes. We choose the type using the type attribute."

Key Input Types:

Text: "The text field is used for normal text, like a name or username."

Email: "The email field is used when the user needs to enter an email address."

Password: "The password field is used for passwords. The characters are hidden while typing."

Radio Buttons: "Radio buttons are used when the user needs to choose only one option."

Checkboxes: "Checkboxes are used when the user wants to select multiple options."

CSS Styling:

"Now, CSS helps us control how these input fields look."

"We can change things like the width, padding, border, border radius, and font size."

2:00 - 4:15 | Live Code Walkthrough

Editor Setup: HTML form with a text field, email field, password field, radio buttons, and checkboxes.

Step 1: Text Field

"First, let's create a simple text field."

```
<input type="text" placeholder="Enter your name">
```

"This creates a text field where the user can enter their name."

"Now, let's use CSS to make it wider and add some spacing."

```
input[type="text"] {  
  width: 100%;
```

```
padding: 10px;
}
```

Step 2: Email and Password

“Next, we have the email and password fields.”

```
<input type="email" placeholder="Enter your email">
```

```
<input type="password" placeholder="Enter your password">
```

“The first one is for an email, while the second one is for a password.”

“We can style them using CSS in the same way.”

```
input[type="email"],
input[type="password"] {
  padding: 10px;
  border: 1px solid gray;
  border-radius: 5px;
}
```

Step 3: Radio Buttons

“Now let’s add radio buttons.”

```
<input type="radio" name="gender" value="male"> Male
<input type="radio" name="gender" value="female"> Female
```

“Here, both radio buttons have the same name.”

“This allows the user to select only one of the choices.”

“We can also add some spacing using CSS.”

Step 4: Checkboxes

“Lastly, let’s add checkboxes.”

```
<input type="checkbox"> HTML
<input type="checkbox"> CSS
<input type="checkbox"> JavaScript
```

“Unlike radio buttons, checkboxes allow the user to select multiple choices.”

“For example, the user can select HTML and CSS at the same time.”

“We now have our main input fields styled and working.”

4:15 - 5:00 | Summary and Conclusion

Host on Camera:

“And that is input fields in CSS. Let’s do a quick recap.”

On-screen checklist:

Text: Used for normal text such as names and usernames.

Email: Used for entering email addresses.

Password: Used for entering passwords.

Radio Buttons: Used when selecting one option.

Checkboxes: Used when selecting multiple options.

CSS: Used to style the appearance of the input fields.

“Input fields are an important part of forms because they allow websites to collect information from users.”

“Once you understand the different input types and basic CSS styling, you can start creating better forms for your websites.”

“Thank you for watching, and happy coding!”
