

CSS Input Fields in 5 Minutes

Text, Email, Password, Radio Buttons, and Checkboxes using `<input>`

Target Audience: Beginner Web Developers

Goal: Viewers will understand how the `<input>` tag works, its common attributes, and how CSS is used to style different input fields.

0:00 - 0:45 | Introduction

Host on Camera:

"Have you ever filled out a form on a website and wondered how those text boxes, buttons, and checkboxes are made?"

"Those are called input fields. They are used when a website needs information or choices from the user."

"Today, we're going to learn five common input fields: text fields, email fields, password fields, radio buttons, and checkboxes."

"We'll also learn what the `<input>` tag does, some of its attributes, and how CSS can be used to style these input fields."

"Let's get started."

0:45 - 2:00 | Concept Explanation

Screen Share: Show a simple HTML form with different input fields.

The Basics:

"First, let's talk about the `<input>` tag."

"The `<input>` tag is an HTML element used to receive information from the user."

"The type of input is controlled by the type attribute."

"For example, type equals text creates a normal text field."

"Type equals email creates a field for an email address."

"Type equals password creates a password field, where the characters are hidden while typing."

"Type equals radio creates a radio button, which is usually used when the user needs to choose only one option."

"And type equals checkbox creates a checkbox, where the user can select multiple choices."

Input Attributes:

"Now, let's talk about some attributes inside the `<input>` tag."

"The placeholder attribute shows a short guide inside the input field. For example, Enter your name."

"The name attribute gives the input a name. This is also important for grouping radio buttons."

"The value attribute gives the input a specific value."

"And the required attribute means the user needs to fill out or select the input before submitting the form."

CSS Styling:

"Now, where does CSS come in?"

"CSS controls how our input fields look."

"We can change the width, padding, border, border radius, font size, and other parts of the design."

2:00 - 4:15 | Live Code Walkthrough

Editor Setup: HTML form with a text field, email field, password field, radio buttons, and checkboxes.

Step 1: Text Field

“First, let’s create a simple text field.”

```
<input type="text" placeholder="Enter your name">
```

“The input tag creates the input field.”

“The type attribute is set to text, so the user can enter normal text.”

“The placeholder attribute shows Enter your name inside the field.”

“Now, let’s use CSS to style it.”

```
input[type="text"] {  
  width: 300px;  
  padding: 10px;  
  border: 1px solid #ccc;  
  border-radius: 4px;  
  font-size: 16px;  
}
```

“Here, input type text selects our text field.”

“Width changes how wide the field is.”

“Padding adds space inside the field.”

“Border adds a line around it.”

“Border radius makes the corners rounded.”

“And font size changes the size of the text.”

Step 2: Email and Password

“Next, let’s add an email field and a password field.”

```
<input type="email" placeholder="Enter your email">  
  
<input type="password" placeholder="Enter your password">
```

“The first one uses type email, so it is made for entering an email address.”

“The second one uses type password, so the characters are hidden while we type.”

“We can also style both of them using the same CSS.”

```
input[type="email"],  
input[type="password"] {  
  padding: 10px;  
  border: 1px solid gray;  
  border-radius: 5px;  
}
```

“Here, we are selecting both the email and password inputs.”

“This saves us from writing the same CSS separately for each one.”

Step 3: Radio Buttons

“Now, let’s add radio buttons.”

```
<input type="radio" name="gender" value="male"> Male  
  
<input type="radio" name="gender" value="female"> Female
```

“Both inputs use type radio.”

“The name attribute is set to gender for both buttons.”

“Because they have the same name, the user can select only one option from this group.”

“The value attribute tells us what value each option has.”

Step 4: Checkboxes

“Lastly, let’s add checkboxes.”

```
<input type="checkbox" value="html"> HTML
```

```
<input type="checkbox" value="css"> CSS
```

```
<input type="checkbox" value="javascript"> JavaScript
```

“Here, the type is checkbox.”

“Unlike radio buttons, checkboxes allow the user to select multiple choices.”

“For example, I can select HTML and CSS at the same time.”

“We now have our five input types, and we also used different attributes to control how they work.”

4:15 - 5:00 | Summary and Conclusion

Host on Camera:

“And that is our discussion about input fields using HTML and CSS.”

“Let’s do a quick recap.”

On-screen checklist:

“Text fields are used for normal text, like names and usernames.”

“Email fields are used for entering email addresses.”

“Password fields are used for entering passwords.”

“Radio buttons are used when selecting one option from a group.”

“Checkboxes are used when selecting multiple options.”

“The <input> tag creates the input field.”

“The type attribute tells the browser what kind of input we want.”

“Attributes like placeholder, name, value, and required give our inputs more information and functionality.”

“And CSS controls how these input fields look, such as their width, padding, border, and font size.”

“Once you understand the <input> tag and these basic attributes, you can start creating forms for your websites.”

“Thank you for watching, and happy coding!”
